

APPARATUS AND METHOD FOR REACTIVATING MULTIPLE
PACKET DATA SESSIONS IN A WIRELESS NETWORK

5 ABSTRACT OF THE DISCLOSURE

A mobile station capable of reactivating at least a dormant first data session and a dormant second data session associated with a first base station of a wireless network. The mobile station transmits to the first base station an Origination message
10 comprising: i) a first Data Ready to Send (DRS) field indicating to the first base station that the dormant first data session is being reactivated; and ii) a second Data Ready to Send (DRS) field indicating that the dormant second data session is being reactivated.
